

Dealing with “Aggressive” or “Unsafe” Behaviors – Part 2

The following are only **suggestions** and will not necessarily apply to all children. Determining **if** or **how** to apply these strategies should be based on the child’s age, communication skills, cognitive and self-regulation abilities. Work closely with your ASD Clinician or other professionals to determine which would be appropriate.

For “Unsafe” Behaviors such as Running Away or “Bolting” - General Guidelines & Strategies

- Try to determine what the child is **gaining** from the behavior:
 - To **get to** a certain area or object (e.g. a favorite toy, room, car, etc)?
 - To **avoid** or **escape from** a certain activity, person, or situation (e.g. a noisy or hectic environment; an unstructured or confusing situation)
 - To meet a need for physical movement?
- Teach child appropriate ways to **communicate** their wants and needs and recognize their positive attempts to do so
- For children who are “bolting” because they are not yet able to ask for a break, teach them to say or sign “break” or give someone a break card instead of bolting
- Use visual supports (e.g. timers, visual schedules) to help child understand what is happening and what is expected. For example, a child may bolt because they don’t yet understanding that the current activity is **ending soon** and their favorite activity is coming **next**
- Remember that because of their neurological differences, many children with ASD often communicate, interact and play like much younger children.

For Behaviors such as Jumping, Pushing and Knocking Things Down

- For some children, it is helpful to keep in mind their younger developmental level. For example, a teenage child may still enjoy playing at a “developmentally younger” stage which involves physical play or exploring things by throwing, banging or dropping them.
- Redirecting and **replacing** the behavior with a more “socially desirable” one should be the main focus. For example, have a variety of more appropriate sensory-seeking activities that he can choose from (e.g. throwing of soft toys into a bucket, jumping on a mini-trampoline, etc.)

- Respond quickly and positively to more “socially desirable” replacement behaviors.
- Respond as slowly and calmly as possible to less desirable behaviors. Avoid big reactions (e.g. yelling or “animated” facial expressions) – this can often reinforce these behavior(s)
- If available, work closely with the child’s Occupational Therapist to explore ways of satisfying sensory needs.
- Use Picture Schedules, PECS systems, and other visual cues (i.e., cardboard STOP signs) to let the child choose activities and to aide transitions to and from these activities.
